G-alpha-16 interacts differentially with several receptor types including members of the opioid and chemokine receptor families. Antisense oligonucleotides that target the present sequence can be used to modulate the expression of G-alpha-16. They may be used to inhibit the expression of G-alpha-16 in human cells and tissues and thus to treat diseases associated with G-alpha-16, such as hyperproliferative disorders, especially cancer. Infections, inflammation or tumour formation can be prevented or delayed. The compounds can be used in research and diagnostics in sandwich and other assays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; G-alpha-16; G protein; cytostatic; hyperproliferative disorder;

This polynucleotide comprises a codin; sequence for murine G-alpha in protein (see AAW42434), a promiscuous G-protein whose subunits allow coupling with G-protein coupled receptors (GPRSA) that normally couple with G-proteins of other families. Stable isolated normally couple with G-proteins of other families. Stable isolated colls are claimed that include a construct comprising an inducible prometer linked to a nucleic acid encoding a promiscuous G-alpha prometer. A murine G-alpha 16 or a huian G-alpha 15 protein polynucleotide (see also AAW03465) is preferably used. The cells may also comprise a second construct in which a reporter gene is G-alpha protein. The cells are used in novel methods for identifying a GPCR for a given ligand, or vice versa, or modulators of signal transduction in a cell and for classifying ligands as agonists or antagonists. Since live cells are used, any identified receptor or ligand coloned, and use of fluorescent detection permits characterisation of individual cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Stable cells containing sequence encoiling promiscuous G-alpha protein - useful to identify G-protein coupled receptors or ligands, and agonists or antagonists of signal transduction in cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Promiscuous G-alpha 16 protein; mouse; G-protein coupled receptor; ligand; agonist; antagonist; signal transduction; ss.

The polypeptide is believed to be a member of the GTP-binding regulatory protein family. The polypeptide is a regulator of signal transduction. The polypeptide is useful for treating an individual in need of enhanced activity or expression of G-protein alpha 16. Antagonists are useful for treating an individual in need to inhibit the activity or expression of G-protein alpha 16. The polypeptide is also useful as an immunogen to produce antibodies and for producing immunological response in mammals. The G-protein alpha 16 polypeptides and polynucleotides are useful in screening for antagonists and agonists of G-coupled protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    receptors.

ArgArgGluPheHisLeuLeuAspSerAlaValTyrTyrLeuSerHisLe 167

Stable cells containing sequence encoding promiscuous G-alpha protein - useful to identify G-protein coupled receptors or ligands, and agonists or antagonists of signal transduction in cells

Claim 4; Page 46-49; 72pp; English.

This polynucleotide comprises a coding sequence for human G-alpha is procedurally evented to the protein (see AAM4235), a promiscuous G-protein whose subunits allow coupling with G-proteins of other families. Stable isolated normally couple with G-proteins of other families. Stable isolated cells are claimed that include a construct comprising an inducible promoter linked to a nucleic acid encoding a promiscuous G-alpha is promoter. Inked to a nucleic acid encoding a promiscuous G-alpha is or a mouse G-alpha is protein. A human G-alpha is or a mouse G-alpha is protein may also comprise a second construct in which a reporter gene is linked to a second promoter that is modulated by a promiscuous of alpha protein. The cells are used in novel methods for identifying a GPCR for a given ligand, or vice versa, or modulators of signal transduction in a cell and for classifying ligands as agonists or anigonists. Since live cells are used, any identified receptor or ligand can be cloned, and use of fluorescent detection permits characterisation of individual cells.

```
The invention relates to G-protein fusion receptors (I) comprising:

(1) in the N to C direction, extracellular (ECD), transmembrane (TMD) and intracellular (ICD) domains, each chosen independently from a CaR calculur receptor), GluR (metabotropic glutamate receptor) and GABABR (gamma-aminobutyric acid receptor); (2) an optional linker attached to the C-terminus of ICD; and (3) a G-protein (GP) linker of Inched to CC the assess function of the various domains and to component, are used to assess function of the various domains and to identify compounds (e.g. allosteric modulators or antagonists) that act component, are used to assess function of the various domains and to identify compounds (e.g. allosteric modulators or antagonists) that act component, or these domains. The modulators are potentially useful for treating or preventing diseases associated with the receptors, e.g. stroke, head or Alzheimer's disease, hyperparathyroidism, osteoprosis, cognitive disorders and depression. Nucleic acid (II) that encodes (I) is used:

(1) for recombinant production of corresponding proteins; and (2) to produce cells used in screening for modulators. Use of CaR and mcluR production allows presentation of GABABR domains, to a binding agent, in a committee receptors, lacking one or more domains. By shuffling different receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                  different receptors, used to screen for modulators, potentially usefule.g. for treating or preventing stroke or Alzheimer's disease
                                                                                                                                                                                                                                                                      Stormann TM, Hammerland LG, Storjohann LL, Busby JG, Garrett JE;

The invention relates to G-protein fusion receptors (I) comprising:

(1) in the N to C direction, extracellular (ECD), transmembrane (TMD) and intracellular (ICD) domains, each chosen independently from a CaRR (Calcium receptor), Gluk (metabotropic glutamate receptor) and GABABR (Calcium receptor), Gluk (metabotropic glutamate receptor) and GABABR (Gamma-aminobutyric acid receptor); (2) an optional linker attached to the C-terminus of ICD; and (3) a G-protein (GP) linked to ICD or the Cidentify component, are used to assess function of the various domains and to identify component. The modulators are potentially useful for treating or preventing diseases associated with the receptors, e.g. stroke, head or spinal cord injury, epilepsy, ischaemia, hypoglycaemia, anoxia, alsorers and appreparathyroidism, osteoporosis, cognitive disorders and appression. Nucleic acid (II) that encodes (I) is used:

(1) for recombinant production of corresponding proteins; and (2) to produce cells used in screening for modulators. Use of CaR and mGluR comming allows presentation of GABABR domains, to a binding agent, in a form more like the natural domain structure compared with use of incomplete receptors, lacking one or more domains. By shuffling different
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           different receptors, used to screen for modulators, potentially useful
e.g. for treating or preventing stroke or Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           G-protein fusion receptor; CaR; calcium receptor; GluR; head injury; metabotropic glutamate receptor; GABABR; chimeric receptor; stroke; gamma-aminobutyric acid receptor; allosteric modulator; antagonist; spinal cord injury; epilepsy; ischaemia; hypoglycaemia; anoxia; cognitive disorder; ss.

The invention relates to G-protein fusion receptors (I) comprising:
(I) in the N to C direction, extracellular (ECD), transmembrane (TMD) and
intracellular (ICD) domains, each chosen independently from a CarR
(calcium receptor), Glum (metabotropic glutamate receptor) and GABAR
(gamma-aminobutyric acid receptor); (2) an optional linker attached to
the C-terminus of ICD; and (3) a G-protein (GP) linked to ICD or the
linker. (1), and recombinant chimeric receptors (CR) without the GP
component, are used to assess function of the various domains and to
identify compounds (e.g. allosteric modulators or antagonists) that act
on these domains. The modulators are potentially useful for treating or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New G-protein fusion receptors and chimeras containing domains from different receptors, used to screen for modulators, potentially useful e.g. for treating or preventing stroke or Alzheimer's disease

preventing diseases associated with the receptors, e.g. stroke, head or spinal cord injury, epilepsy, ischaemia, hypodyycemia, anoxia, Alzheimer's disease, hyperparathyroidism, osteoporosis, cognitive disorders and depression. Nucleic acid (II) that encodes (I) is used: (1) for recombinant production of corresponding proteins; and (2) to produce cells used in screening for modulators. Use of CaR and mGluR domains allows presentation of GABABR domains, to a binding agent, in a form more like the natural domain structure compered with use of incomplete receptors, lacking one or more domains. By shuffling different domains, agents can be identified that affect particular domains of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            3133 TGCCTGAGCGAGGAGGCCAAGGAAGCCCGGCGGATCAACGACGAGATCGA 3182

The invention relates to G-protein fusion receptors (I) comprising:

(1) in the N to C direction, extracellular (ECD), transmembrane (TMD) and intracellular (ICD) domains, each chosen independently from a CaR (all time receptor), Gluk (metabotropic glutamate receptor) and GABABR (C calcium receptor), Gluk (metabotropic glutamate receptor) and GABABR (G damma-aminobutyric acid receptor); (2) an optional linker attached to the C-terminus of ICD; and (3) a G-protein (GP) linked to ICD or the C dentify component of ICD; and session thimmerics (BP) linked to ICD or the C component, are used to assess function of the various domains and to component, are used to assess function of the various domains and to dentify compounds (e.g. allosteric modulators or antagonists) that act con these domains. The modulators are potentially useful for treating or preventing diseases associated with the receptors, e.g. stroke, head or spinal cord injury, epilepsy, ischaemia, hypoglycaemia, anoxia, confiders and depression. Nucleic acid (II) that encodes (I) is used: disorders and depression. Nucleic acid (II) that encodes (I) is used: disorders and edpression. Nucleic acid (II) that encodes (I) is used: condition allows presentation of Corresponding proteins; and (2) to produce cells used in screening for modulators. Use of CaR and mGluR commons allows presentation of GABABR Gomains, to a binding agent, in a complete receptors, lacking one or more domains. By shuffling different domains, agents can be identified that affect particular domains of a
                                                               New G-protein fusion receptors and chimeras containing domains from different receptors, used to screen for modulators, potentially useful e.g. for treating or preventing stroke or Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   3392 CCATGGACACACTCAAGATCCCATACAAGTATGAGCACAATAAGGCTCAT 3441

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAZ31062:
```

```
The invention relates to G-protein fision receptors (I) comprising:

(I) in the N to C direction, extracellular (ECD), transmembrane (TMD) and
intracellular (ICD) domains, each chosen independently from a CaR
calcium receptor), GluR (metabotropic glutamate receptor) and GABABR

(Gamma-aninobutyric acid receptor); (2) an optional linker attached to
the C-terminus of ICD; and (3), a G-protein (GP) linked to ICD or the
Component, are used to assess function of the various domains and to
component, are used to assess function of the various domains and to
component, are used to assess function of the various domains and to
component, are used to assess function of the various domains and to
component, are used to assess function of the various domains and to
component, are used to assess function of the various domains, and
con these domains. The modulators are potentially useful for treating or
preventing diseases associated with the receptors, e.g. stroke, head or
spinal cord injury, epilepsy, ischaemia, hypoglycaemia, noncia,
continuents and depression. Nucleic acid (II) that encodes (I) is used:
cli for recombinant production of corresponding proteins; and (2) to
produce cells used in screening for redispinance in containing and in screening for modulators use of car and mGluR
complete receptors, lacking one or more domains, up whith use of
commanders and benefitied that affect particular domains of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New G-protein fusion receptors and chimeras containing domains from different receptors, used to screen for modulators, potentially useful. e.g. for treating or preventing strole or Alzhelmer's disease
                                                                                                                                                                                                                                                                                                                                                                                       Stormann TM, Hammerland LG, Storjohann LL, Busby JG, Garrett JE;
  spinal cord injury; epilepsy; ischaemia; hypoglycaemia; anoxia; Alzheimer's disease; hyperparathyroidism; osteoporosis; depression; cognitive disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     :||| ||| ||| 3255 GCGGCAGCTCCGCAGGGACAAGCGGGACGCCCGGCAGCTCAAGCTGC 3304

The invention relates to G-protein fusion receptors (1) comprising:

(1) in the N to C direction, extracellular (ECD), transmembrane (TMD) and intracellular (ICD) domains, each chosen independently from a CRR intracellular (ICD) domains, each chosen independently from a CRR (Calcium receptor), Gluk (metabotropic glutamate receptor) and GABABR (Calcium receptor), Gluk (metabotropic glutamate receptor) and GABABR (Calcium receptor); (2) an optional linker attached to the creaminobutyric acid recombinant chimeric (EQ) linked to ICD or the component, are used to assess function of the various domains and to component, are used to assess function of the various domains and to component, are used to assess function of the various formains and to component, are used to assess function of the various domains and to operventing diseases associated with the receptors, e.g. stroke, head or spinal cord injury, epilepsy, ischemia, hypoglycaemia, anoxia, capinal cord injury, epilepsy, ischemia, hypoglycaemia, anoxia, capinal cord injury, epilepsy, ischemia, octoporosis, cognitive compared miner production of corresponding proteins; and (2) to produce cells used in screening for modulators. Use of CaR and mGluR communic allows presentation of GABABR domains, to a binding agent, in a complete receptors, lacking one or more domains. By shuffling different compared with, agents can be identified that affect particular domains of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New G-protein fusion receptors and chimeras containing domains from different receptors, used to screen for modulators, potentially useful e.g. for treating or preventing stroke or Alzheimer's disease
                                                                                                                                                                                                                                                                                                       G-protein fusion receptor; CaR; calcium receptor; GluR; head injury; metaborropic glutemate receptor; GABABR; chimeric receptor; stroke; gamma-aminobutyric acid receptor; allosteric modulator; antagonist; spinal cord injury; epilepsy; ischaemia; hypoglycaemia; anoxia; Alzheimer's disease; hyperparathyroidism; osteoporosis; depression; cognitive disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Stormann TM, Hammerland LG, Storjohann LL, Busby JG, Garrett JE;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 3969 BP; 945 A; 1079 C; 1065 G; 880 T; 0 other;

The invention relates to G-protein fusion receptors (I) comprising:
(I) in the N to C direction, extracellilar (ECD), transmembrane (TMD) and
intracellular (ICD) domains, each chosen independently from a car
(calcium receptor), GluR (metabotropic glutamate receptor) and GABABR
(gamma-aminobutyric acid receptor); (2) an optional linker attended to
the C-terminus of ICD; and (3) a G-proisin (GP) linked to ICD or the
linker. (I), and recombinant chimeric .eceptors (CR) without the GP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New G-protein fusion receptors and chimeras containing domains from different receptors, used to screen for modulators, potentially useful e.g. for treating or preventing stroke or Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        G-protein fusion receptor; CaR; calcium receptor; GluB; head injury; metabotropic glutamate receptor; GABANR; chimeric receptor; stroke; gamma-aminobutyric acid receptor; allosteric modulator; antagonist; spinal cord injury; epilepsy; ischaemia; hypoglycaemia; anoxia; Alzheimer's disease; hyperparathyroid.sm; osteoporosis; depression; cognitive disorder; ss.

```
component, are used to assess function of the various domains and to identify compounds (e.g. allosteric modulators or antagonists) that act on these domains. The modulators are potentially useful for treating or preventing diseases associated with the receptors, e.g. stroke, head or spinal cord injury, epilepsy, ischaemia, hypolycaemia, anoxia, alzheimer's disease, hyperparathyroidism, osteoporosis, cognitive disorders and depression. Nucleic acid (II) that encodes (I) is used: (I) for recombinant production of corresponding proteins; and (2) to produce cells used in screening for modulators. Use of CaR and mGluR domains allows presentation of GaBBBR domains, to a binding agent, in a form more like the natural domain structure compared with use of incomplete receptors, lacking one or more domains. By shuffling different domains, agents can be identified that affect particular domains of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               3310 TATCTTAATGACTTGGACCGCGTAGCTGACCTGCCTACCTGCCTACGCA 3359

A method has been developed of defining a set of compounds that modulate the expression of a target nucleic acid (tNA) sequence via binding of the compounds with the tNA sequence. The method compounds properlies generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual compounds with the tNA according to defined criteria. Also described are: (1) a method of a tNA according to defined criteria. Also described are: (1) a method of a tNA sequence via binding of the obswith the tNA sequence comprising criteria, and evaluating in silico the binding of the virtual ons with the tNA sequence comprising criteria, and evaluating in silico the binding of the virtual ons with cotten in silico according to defined criteria, and (2) a method of defining set of compounds with the tNA. The methods can be used for the physical, chamical or bioactive properties. Information gathered from a saays of such compounds with the tNA. The methods can be used for the physical, chamical or bioactive properties. Information gathered from a recent of sasays of such compounds is used to identify nucleic acid sequences that caretable to a variety of nucleotide sequence-based technologies, antisense drug discovery and target validation. AAZ40220, and AAZ40220, and AAZ40220, represent sequences used in the
                                                                                                                Identifying compounds which modulate expression of nucleic acids, used to provide compounds having defined physical, chemical or bioactive properties, e.g. antisense activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  228 CAAGCTCGTCTACAGAACATCTTCACCGCCATGCAGGCCATGATCCGGG 277

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes inhibitory antisense compounds of 8-30 nucleotides, targeted to a nucleic acid molecule encoding human G-alpha-11. The present sequence encodes human G-alpha-11. AAZ19468 to AAZ19547 represent human G-alpha-11 phosphorothioate antisense oligonucleotides given in the present invention. The oligonucleotides may be useful for the treatment of diseases associated with G-alpha-11.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inhibitory antisense compounds useful for the treatment of diseases associated with G-alpha-11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   228 CAAGCTGGTCTACCAGAACATGTTCACGGGGTGGAGGCGATGATGATGGGG 277

The present invention relates to a method for identifying a compound that modulates sensory signalling in taste cells, comprising contacting polypeptide. A suitable peptide is encoded by the present sequence, mouse TC-calphal4 DNA. The compounds identified by the present method may be used by the food and pharmeceutical industries to customize traste as additives for food or medicines so that they taste different
                                                                                                                                                                                                                                                                                                                                       Assaying for compounds that modulate sensory signalling in taste cells, by determining interactions between the compounds and a sensory cell specific G-protein alpha subunit polypeptide -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    166 TGCTGC.....TGTTTGTCTGCGGAGGAGAAAGAGTCTCAGCGCATCAG 209

```
This is the nucleotide sequence encoding the rat gustducin alpha-subunit protein used in the method of the invention to modify taste. The peptides or fragments can be delivered to taste receptor cells to modify taste, e.g. mimic or inhibit sweet and/or bitter tastes. The polypeptides can also be used in screening assays for taste-modifying agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New purified and isolated rat gustducin alpha-subunit polypeptide - can be delivered to taste receptor cells to modify taste, e.g. mimic or inhibit sweet and/or bitter tastes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 126 ATTAGTTCAGAGAGCAAGGAGTCAGCCAAAAGGTCCAAAGAACTGGAGAA 175
